## Visual Math

## Interpolation and extrapolation

Variables are ordered and a trapezoid x 1 y 1 y 3 x 3 is created and desired: y 2 from x 2 .

| $y 1$ | $y 2$ | $y 3$ |
| :---: | :---: | :---: |
| 50 | $\underline{78}$ | 90 |
| 20 | 48 | 60 |
| $x 1$ | $x 2$ | $x 3$ |

| Excel | X | Y |
| :---: | :---: | :---: |
| 1 | 20 | 50 |
| 2 | 48 | $\underline{78}$ |
| 3 | 60 | 90 |

$y 2=y 1+(x 2-x 1)^{*}(y 3-y 1) /(x 3-x 1)$
In Excel, formula can be inserted into standard cells Y2, etc.
Interpolation is possible: for 4 cells and tables entirely.
Interpolation and extrapolation are possible through graphical programs.
Coordinate in middle: arithmetic mean
$y 2=(y 1+y 3) / 2$

## Excel formulas

Example: Excel multiplication table and multipliers horizontally and vertically.
Product is calculated by formula

$$
\begin{equation*}
=B \$ 1 * \$ A 2 \tag{3}
\end{equation*}
$$ where $\$$ sign makes a row or column constant and formula expands.

If $\$$ sign is assigned to a row and a column at same time: $=\$ B \$ 1 * 1000$
Cell with $2 \$$ signs: constant when copying and pasting.

## Word automation

Word can automatically number ordinals, such as paragraph numbers or image numbers or formula numbers, and rearranging paragraphs provides numbers in order.

Word includes headers and footers for decorating repeating elements.
Word can automatically number pages and write number of pages.
Word formulas can be arranged in a table by setting invisible cell borders.
Word can replace characters using special characters, for example, multiple Enter in a row is replaced by 2 Enter.

Word or Excel can create a simple macro manually from actions on screen.

## Visual Math

## Inflation

Inflation to power of years calculates price multiplier Inflation ^ Years = Factor
Inflation: Inflation = Factor ^(1/Years)
Years: $\quad$ Years $=$ LOG(Factor)/LOG(Inflation)
Example: if multiplier is 12 over 15 years: inflation $=12^{\wedge}(1 / 15)=+18 \%$.
Example: if multiplier is 12 \& inflation is $18 \%$, years: $=L O G(12) / L O G(1,18)=15$ years.

## Salary

Suppose several workers receive a small salary and 1 manager receives a large salary and it is required to find number of employees to form a given average salary.

We denote: $\mathrm{B}=$ high pay and $\mathrm{C}=$ average pay and $\mathrm{M}=$ low pay and $\mathrm{N}=$ number of employees who receive little and mean

$$
\begin{align*}
& \left(\mathrm{B}+\mathrm{M}^{*} \mathrm{H}\right) /(\mathrm{H}+1)=\mathrm{S}  \tag{8}\\
& \mathrm{H}=(\mathrm{B}-\mathrm{S}) /(\mathrm{S}-\mathrm{M}) \tag{9}
\end{align*}
$$

Excel compatible programs allow you to assign any names to cells to left of formula bar, and formulas in Russian are possible.

Example: $\mathrm{B}=300$ and $\mathrm{M}=28$ and $\mathrm{C}=45$ and $\mathrm{H}=(\mathrm{B}-\mathrm{S}) /(\mathrm{S}-\mathrm{M})=(300-45) /(45-28)=$ $=255 / 17=15$ people and check: $=\left(300+28^{*} 15\right) /(15+1)=45$.

Math programs calculate $\mathrm{N}=(\mathrm{S}-\mathrm{B}) /(\mathrm{M}-\mathrm{S})$.
Formulas in detail:

## Definitions

Integral: sum of multiplications of quantity and quality.
Logarithm: number of multiply to desired result: "to what degree to raise".
Factorial: Multiply from 1 to desired number.
Derivative: tangent of slope of graph's tangent.
Percentage: 1 in 100 parts and permille: 1 in 1000 parts.
Probability: event opportunity $0<=P=$ events/variants < 100\%.
Integral: from word integer.
Logarithm: from word ratio.
Factorial: from word multiplying.

## Visual Math

## Derivative

Derivative: tangent of slope of tangent of function graph.
Derivative 1st: minimax function.
Visual: horizontal tangent plot of a function.
Derivative 2nd: function inflection.
Visually: change in direction of angular movement of tangent of graph.
Path and derivative 1st: speed.
Derivative 2nd: acceleration and derivative 3rd: start.

## Integral

Constant value: time, seconds.
Specific value: speed, meters per second.
Time periods: 1 second.
Each square product: time seconds
multiplied by speed of meters per second and get path, meters.

Summing up entire path for a given time and distributing it evenly over time:

Vertical average speed of 3 meters per second, shows mean value of integral.

## Visual Math

## Combinatorics

Number of combinations of 2 characters: $\quad \mathrm{N}=\mathrm{X} *(\mathrm{X}-1) / 2$

|  | A | B | C | D |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
| B | AB |  |  |  |  |
| C | AC | BC |  |  |  |
| D | AD | BD | CD |  |  |
| E | AE | BE | CE | DE |  |

| $\mathrm{X}=3$ | a b c | $\mathrm{N}=3^{*} 2 / 2=6 / 2=3$ | ab ac bc |
| :--- | :--- | :--- | :--- |
| $\mathrm{X}=5$ | a b c de | $\mathrm{N}=5^{*} 4 / 2=20 / 2=10$ | ab ac ad ae bc bd be cd ce de |

Connect of 2 points encrypt 2 bits of a 2 -ry of form DA $=1001$.
Transport task: number of connections by 2 points.
Combinations of 2 topics of this manual are possible.

## Pattern Excel

Events 2-ary controls multiplication of events, including $=\mathrm{NOT}()$ functions

$$
\begin{equation*}
X=(\mathrm{A} 1 \mid \operatorname{NOT}(\mathrm{A} 1)) \ldots \text { * } \ldots \text { * }(\mathrm{AN} \mid \operatorname{NOT}(\mathrm{AN}))=(0 \mid 1) \tag{12}
\end{equation*}
$$

Example: find an event like 1010011:
=A1 *NOT(A2) *A3 *NOT(A4) *NOT(A5) *A6 *A7 = ( 0=no | 1=yes )

Explored big data is possible in non-consecutive cells.
Another pattern checks all numbers in a row from 1 to N are mixed:

$$
\begin{equation*}
\text { for "2 } 4531^{\prime \prime}=2^{\wedge} 2+2^{\wedge} 4+2^{\wedge} 5+2^{\wedge} 3+2^{\wedge} 1=62=2^{\wedge}(N+1)-2 \tag{14}
\end{equation*}
$$

## Guess number

computer guesses number X , guessed automatically or by a person,
for number of steps logarithmic

$$
\begin{equation*}
\mathrm{N}=\operatorname{LOG}(\mathrm{X} ; 2) \tag{15}
\end{equation*}
$$

Guessing is optimal to start from middle of array.
For example, 1 out of a billion is equal to 1 out of $X=10^{\wedge} 9$, guessed in $N=30$ moves:

$$
\begin{gather*}
N=\operatorname{LOG}\left(10^{\wedge} 9 ; 2\right)=30  \tag{16}\\
10^{\wedge} 3=2^{\wedge} 10 \tag{17}
\end{gather*}
$$

Dependency of 10-ary and 2-ary:
Number of $N$ guesses $X$ : for each increase in $X$ by 1000 times +10 guesses.

## Visual Math

## Speed

Speed from kilometers per hour to meters per second is translated by formula based on $36 \mathrm{~km} / \mathrm{h}=10 \mathrm{~m} / \mathrm{s}$

$$
\begin{align*}
& \mathrm{V}(\mathrm{~m} / \mathrm{s})=\mathrm{V}(\mathrm{~km} / \mathrm{h}) / 3.6  \tag{18}\\
& \mathrm{~V}(\mathrm{~km} / \mathrm{h})=\mathrm{V}(\mathrm{~m} / \mathrm{s}) * 3.6 \tag{19}
\end{align*}
$$

It is useful to translate speed of kilometers per minute into meters per second in your mind $1 \mathrm{~km} /$ minute $=60 \mathrm{~km} / \mathrm{h}=16.7 \mathrm{~m} / \mathrm{s}$
Examples: $20 \mathrm{~m} / \mathrm{s}=72 \mathrm{~km} / \mathrm{h}=1.2 \mathrm{~km} / \mathrm{min}$ or $8000 \mathrm{~m} / \mathrm{s}=28800 \mathrm{~km} / \mathrm{h}=480 \mathrm{~km} / \mathrm{min}$.

## Excel proportion

3 cells A1, B1, A2 are filled
and formula is set in cell
$B 2=B 1 * A 2 / A 1$
Example: video scaling and screen resolution are calculated.

|  | A | B |
| :---: | :---: | :---: |
| 1 | A1 | B1 |
| 2 | A2 | B2 |

| Excel | A | B |
| :---: | :---: | :---: |
| 1 | 16 | 9 |
| 2 | 1280 | $\underline{\mathbf{7 2 0}}$ |

Example: assessing incidence, proportion is calculated:
number of inhabitants of region relative to number of inhabitants of country and planet.

## Binomiality

Binomial: each element is approximately 2 times next.
Binomial percentage distribution: $56+24+14+6=100$.

A square $10 \times 10=100$ cells divides point at location 2 into 3 cells and whole zones are obtained $2 \times 3=6$ and $2 \times 7=14$ and $3 \times 8=24$ and $7 \times 8=56$.

Possibly specific to processes where a 2 by 2 table is created and a pattern is noticeable: $24 \%$ is 4 times more than $6 \%$ and $56 \% / 14 \%=4$. Shared formula $x+2 x+4 x+8 x=100 \& x=6,67 \&$ relations $80 \% \backslash 20 \%$ \& $70 \% \backslash 30 \%$.

An array of thousands of random elements 10101 creates similar chains in a row and same number of chains in a row is distributed binomially, of form:
1 in a row 64 pieces, then 2 in a row 32 pieces and 3 in a row 16 pieces, etc., which means that array under study, distributing chains in a row binomially: random and quantum random observe principles of binomial distribution.

## Visual Math

## Percent

Having deposit money at $P \%$ for $Y$ years, expect multiplier $M . M=(1+P / 100)^{\wedge} Y$

Percentage
$P=-100^{*}\left(1-M^{\wedge}(1 / Y)\right)$
$\mathrm{P}=100^{*}\left(\mathrm{M}^{\wedge}(1 / \mathrm{Y})-1\right)$

## Probability Reliability

Probability of an event and reliability of probability are given, and it is possible to calculate normal number of repetitions of similar cases in a row.
$P$ - probability of event, for example $25 \%=0.25=1 / 4=1 / 4=25 / 100$.
C - reliability of case, for example $99 \%=0.99=99 / 100$.
N - number of similar cases in a row.
Match and mismatch are interchangeable and probability of a match is one minus probability of a mismatch, then $\mathrm{C}=1-\mathrm{c}$ and $\mathrm{c}=1-\mathrm{C}$ and $\mathrm{P}=1-\mathrm{p}$ and $\mathrm{p}=1-\mathrm{P}$ and these formulas are valid for probability over $50 \%$.

Probability multiplication including reliability $\quad \mathrm{C}+(1-\mathrm{P})^{\wedge} \mathrm{N}=1$
calculating degree, calculates number of similar cases in a row

$$
\begin{equation*}
N=\operatorname{LOG}(1-C) / \operatorname{LOG}(1-P) \tag{27}
\end{equation*}
$$

Example: reliability $\mathrm{C}=99 \%$ probability $\mathrm{P}=25 \%$
Normal number of similar in a row $\mathrm{N}=\mathrm{LOG}(1-0.99) / \mathrm{LOG}(1-0.25)=16$
and it means that at a probability of $25 \%$ it's normal not to match 16 times in a row and real mathematicians understand difference between LOG and LN in formulas.

Simplified formula $\quad N=7+\left(5^{*}(1 / \mathrm{P}-2)\right)$
Example: $\mathrm{P}=0.1$ and $\mathrm{N}=47$ is normal and $\mathrm{P}=0.78$ and $\mathrm{N}=4$ is normal.
Inverse problem: calculate probability of a case if reliability is ensured for a given number of cases $\quad P=1-(1-C)^{\wedge}(1 / N)$

Let's calculate reliability of probability.
Each worker does $78 \%$ of work.
Determine number of employees to complete work by $99 \%$.
Given: probability $\mathrm{P}=78 \%$ and reliability $\mathrm{C}=99 \%$.
Formula: $\mathrm{C}+(1-\mathrm{P})^{\wedge} \mathrm{N}=1$.
$\mathrm{N}=\mathrm{LN}(1-\mathrm{C}) / \mathrm{LN}(1-\mathrm{P})=\mathrm{LN}(1-0.99) / \mathrm{LN}(1-0.78)=3$.
Answer: 3 workers are needed.
Division of such cases in a row in reality: temperature seams of rails and change of seasons and change of time of day and breathing and sleep and wages, etc.

## Visual Math

## Probability Reliability

Table filling formula: $\quad=$ LOG(1-\$B6/100)/LOG(1-1/D\$1)

| Success Probability | $1 \text { of }$ | 2 | 3 | 4 | 5 | 10 | 100 | 1.5 | 1.25 | Success Probability |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Refusal Probability | \% | $\begin{aligned} & 50 \\ & \% \end{aligned}$ | $\begin{aligned} & 66 \\ & \% \end{aligned}$ | $\begin{aligned} & 75 \\ & \% \\ & \hline \end{aligned}$ | $\begin{aligned} & 80 \\ & \% \end{aligned}$ | $\begin{aligned} & 90 \\ & \% \end{aligned}$ | $\begin{aligned} & 99 \\ & \% \end{aligned}$ | $\begin{aligned} & 33 \\ & \% \\ & \hline \end{aligned}$ | $\begin{aligned} & 80 \\ & \% \end{aligned}$ | Refusal Probability |
|  |  | Similar IN a ROW |  |  |  |  |  |  |  |  |
| Reliability | 90\% | 3 | 6 | 8 | 10 | 22 | 229 | 2 | 1 | Reliability |
| Reliability | 99\% | $\underline{7}$ | $\underline{12}$ | 16 | $\underline{\underline{21}}$ | 44 | $\underline{458}$ | 4 | $\underline{3}$ | Reliability |
| Reliability | 99.5\% | 10 | 17 | 24 | 31 | 66 | 687 | 6 | 4 | Reliability |
| Reliability | 95\% | 4 | 7 | 10 | 13 | 28 | 300 | 3 | 2 | Reliability |
| Reliability | 50 \% | 1 | 2 | 2 | 3 | 7 | 69 | 1 | 0 | Reliability |
|  |  | Similar IN a ROW |  |  |  |  |  |  |  |  |
| Refusal Probability | \% | $\begin{aligned} & 50 \\ & \% \\ & \hline \end{aligned}$ | $\begin{aligned} & 66 \\ & \% \\ & \hline \end{aligned}$ | $\begin{aligned} & 75 \\ & \% \\ & \hline \end{aligned}$ | $\begin{aligned} & 80 \\ & \% \\ & \hline \end{aligned}$ | $\begin{aligned} & 90 \\ & \% \\ & \hline \end{aligned}$ | $\begin{aligned} & 99 \\ & \% \end{aligned}$ | $\begin{aligned} & 33 \\ & \% \\ & \hline \end{aligned}$ | $\begin{aligned} & 80 \\ & \% \\ & \hline \end{aligned}$ | Refusal Probability |
| Success Probability | $1 \text { of }$ | 2 | 3 | 4 | 5 | 10 | 100 | 1.5 | 1.25 | Success Probability |

To guess probability of 25\%=1/4=0.25 and get 99\% reliability
You need 16 consecutive actions.

## Permutations and factorial

Given: 5 books to read in order.
Find number of options for reading books.
We distribute books according to list:
1st book can be read anywhere from 5 2nd book can be read anywhere from 4
3rd book can be read anywhere from 3
4th book can be read anywhere from 2
5th book can be read anywhere from 1
Multiplying: $=1$ * 2 * 3 * 4 * $5=120$ options for reading order of 5 books.
number of permutations calculates factorial of a number $\mathrm{N}!=1$ * ... * N

## Sorting and Shuffling Excel

Excel sorting is possible for 1 column and for several related columns.
Excel shuffling occurs through ordering of random cell values created by a formula of form
=randbetween $(1 ; 1000)$
[32]
Next, by copying a random array and inserting it into a free column as a «Special Insert - Values» and sorting linked list with data.

## Visual Math

## Fractions

It is important to visually understand simple fractions in order to evaluate:
result is greater than 1 or result is less than one,
for example $5 / 4>1$, but $4 / 5<1$ without conversion to decimals.
Table shows sums of 2 fractions, where some results are often found in reality and it is convenient to notice obvious fractions of form 1/5 of 25 hours
\& count fractions of third \& quarter in mind \& multiply money in form $=50 * 12=600$.

Circle is visually clearer and examples show sums of fractions of circle that are nearby, for example $=1 / 2+1 / 3=5 / 6$ or $=1 / 6+1 / 3=1 / 2$.
Another diagram quickly shows $=1 / 6+1 / 12=1 / 4$.
Another diagram quickly shows $=1 / 12+1 / 4+1 / 6+1 / 6=2 / 3$.
Plus, other options are visible and their combinations are possible.

Verification table of decimals: calculates 1 formula

$$
\begin{equation*}
C 3=C \$ 2+\$ B 3 \tag{34}
\end{equation*}
$$

and then copied horizontally and vertically

|  | A | B | C | D | E | F | G |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 1 | Sum <br> of fractions | $1 / 2$ | $\underline{0,5}$ | $1 / 3$ | $1 / 4$ | $\underline{0,33}$ | $\underline{0,25}$ |  |  |  |
| $\mathbf{2}$ | $\underline{0,2}$ | $\underline{0,2}$ | $\underline{0,167}$ |  |  |  |  |  |  |  |
| 3 | $1 / 2$ | $\underline{0,5}$ | $\underline{1}$ |  |  |  |  |  |  |  |
| 4 | $1 / 3$ | $\underline{0,33}$ | 0,833 | 0,667 |  |  |  |  |  |  |
| 5 | $1 / 4$ | $\underline{0,25}$ | 0,75 | 0,583 | 0,5 |  |  |  |  |  |
| 6 | $1 / 5$ | $\underline{0,2}$ | 0,7 | 0,533 | 0,45 | 0,4 |  |  |  |  |
| 7 | $1 / 6$ | $\underline{0,167}$ | 0,667 | 0,5 | 0,417 | 0,367 | 0,333 |  |  |  |

## Visual Math

## Beam

Bending stiffness of beam depends on value of «moment of inertia» $I, m^{4}$ meters to 4th power and calculates formula:

$$
\begin{equation*}
I=\frac{b h^{3}}{12} \tag{35}
\end{equation*}
$$

where $b$ is width of beam section and $h$ is height of beam section

and formula itself is derived as an integral in terms of antiderivatives.
Let's say a beam with dimensions of section $2 b$ and $h=b$
Then formula: $\quad I=\frac{2^{*} b^{*} b^{3}}{12}=\frac{2 b^{4}}{12}$
Let's say a beam with dimensions of section $b \& h=2 b$ separately
Then formula: $\quad I=\frac{b^{*} 2^{*} b^{3}}{12}=\frac{2 b^{4}}{12}$
Suppose a beam with dimensions of section $b \& h=2 b$ is one
Then formula: $\quad I=\frac{b^{*}\left(2^{*} b\right)^{3}}{12}=\frac{8 b^{4}}{12}$
Conclusion: vertical section of a single beam is 4 times better.

## Quadratic equation

Let's say in field a plot where 1 side is x meters and other side is 45 meters longer.
Find x so that area of site becomes $10,000 \mathrm{~m}^{2}$.

We compose a quadratic equation of form $\mathrm{ax}^{2}+\mathrm{bx}+\mathrm{c}=0$
$x 1=\frac{-b+\sqrt{b^{2}-4 a c}}{2 a}=\left(-b+\operatorname{sqrt}\left(b^{\wedge} 2-4^{*} a^{*} c\right)\right) /\left(2^{*} a\right)$
$x 2=\frac{-b-\sqrt{b^{2}-4 a c}}{2 a}=\left(-b-\operatorname{sqrt}\left(b^{\wedge} 2-4^{*} a^{*} c\right)\right) /\left(2^{*} a\right)$
Equation of task about site: $x^{*}(x+45)=10000$
$x^{2}+45 x-10000=0$, where $a=1, b=45, c=-10000$.
Discriminant $\quad D=b^{2}-4 a c$
$\mathrm{D}=45^{*} 45-\left(4^{*} 1^{*}(-10000)\right)=42025$
$\mathrm{x} 1=(-45+205) /\left(2^{*} 1\right)=80 \mathrm{~m}$
$\mathrm{x} 2=(-45-205) /\left(2^{* 1}\right)=-125 \mathrm{~m}<0$ impossible distance.
Check: $=80 *(80+45)=80 \mathrm{~m} * 125 \mathrm{~m}=10000 \mathrm{~m}^{2}$.

Parabola $y=x^{2}$ graph: constant increment of change

## Visual Math

## Cumulative Excel chart

Cumulative graph shows integral of data, summing up previous total and next result $B 3=B 2+A 3$
and copying cell B 3 down and then inserting graph and adding a trend line.

|  | A | B | $\begin{aligned} & \hline 6 \\ & \hline \end{aligned}$ |  |
| :---: | :---: | :---: | :---: | :---: |
| 1 | Result | Total |  |  |
| 2 |  |  |  |  |
| 3 | -1 | -1 | 2 | $\cdots$ |
| 4 | -3 | -4 |  |  |
| 5 | 5 | 1 |  | , |
| 6 | -1 | 0 | 0 |  |
| 7 | -3 | -3 |  | $\cdots$ |
| 8 | 6 | 3 |  |  |
| 9 | -1 | 2 |  | - |
| 10 | -2 | -1 |  |  |
| 11 | 7 | 6 |  |  |

## Division of similar events in a row

Modeling processes where several costs in a row are of passive type and then 1 success of type of active,
as a result, a growing graph is created, similar to fractal
and each time wave is calculated using a logarithm.

Wave includes features: frequency \& amplitude.

Успех каждый 7-й

## Trigonometry

Sine of angle: ratio of opposite cathet to hypotenuse $\sin \mathrm{A}=\mathrm{BC} / \mathrm{AC} \quad[41]$

Cosine of angle: ratio of adjacent cathet to hypotenuse $\cos A=A B / A C$

A

Computer calc functions through series including degree \& factorial.
Area of triangle is calculated by matrix of coordinates of angles.

## Mathematics

First, studied addition of integer digits. further addition of integers numbers further multiplication of integer digits further multiplication of integers numbers further addition of non-integer numbers further multiply of non-integer numbers: integral further integer powers of integer digits further integer powers of integers numbers further integer powers of non-integer numbers

Options 2 quantitative and 2 qualitative create 4 combinations

Example: a transportation problem creates its own square of solutions.

Solution options:
if an event occurs: what will happen? if event does not happen: what will happen? if an event occurs: what will not happen?

## Decision square

if event does not happen: what will not happen?

## Random in a row

Random graphically include identical consecutive, distributed binomial and each greater number of identical consecutive is 2 times less than previous one, controlling randomness

KeyWords 27

## Visual Math

## Knapsack 0-1 binary

It is required to integrally assemble a set of many items, having value and mass, limiting maximum mass, in order to get most value.

Understanding: a thing in a set is either there or not, they are compiled all possible combinations of N elements in amount $=2^{\wedge} \mathrm{N}$, for example, with $\mathrm{N}=5$, ciphers from 00000 to 11111 are synthesized and as a result, most valuable integral set is found.

Algorithm Knapsack 0-1 binary implemented in many languages programming and is checked through internet by online compilers.

## Sorting halves

Considering: array includes elements no more and no less than average, bubble sorting is converted into several: from 2 to 8 small parts of array sorting and total sorting is accelerated up to 20 times and recursive algorithm sorts a million: $1,000,000$ elements in 0.3 seconds.

Number of permutations former $\mathrm{Z}=\mathrm{N}^{*}(\mathrm{~N}-1) / 2$, decreases and improves to:

$$
\begin{equation*}
Z=\log (N ; 2)^{*}\left(N / \log (N ; 2)^{*}(N / \log (N ; 2)-1) / 2+2^{*} N / \log (N ; 2)\right) \tag{49}
\end{equation*}
$$

## Divisibility

Number is divisible by 2
Number is divisible by 3 Number is divisible by 5 Number is divisible by 9

Number is divisible by 11
if rightmost digit if sum of all digits if rightmost digit if sum of all digits
is divisible by 2 . is divisible by 3 . is divisible by 5 . is divisible by 9 .
if sum of all digits in even places is equal to sum of all digits in odd places.

## Visual Math

## Visual Math

## Lever balance

Lever balance is integral each of 2 sides through moment $\mathrm{kg}^{*} \mathrm{~m}$, equal to product weight $P \mathrm{~kg}$ on shoulder L m

$$
\begin{equation*}
\mathrm{M} 1=\mathrm{P}^{*} \mathrm{~L} \text { and } \mathrm{M} 2=\mathrm{P}^{*} \mathrm{~L} \tag{50}
\end{equation*}
$$

If shoulder $L \mathrm{~m}$ is reduced in 2 times, having become $\mathrm{L} / 2 \mathrm{~m}$, then balance will create mass $2^{*} \mathrm{P}$ kg in 2 times more

$$
\begin{equation*}
P * L=2 * P * L / 2=P * L \tag{51}
\end{equation*}
$$

## Squares

Maximum square $(a+b)^{2}$ includes $c^{2}$ and triangulars I-IV, if rearranged differently,
obviously: $a^{2}+b^{2}=c^{2}$
$(a+b)^{2}=a^{2}+2 a b+b^{2}$

## Duct section and Pipe diameter

Side of duct channel section d , m , knowing flow rate $\mathrm{L}, \mathrm{m}^{3} / \mathrm{h}$ and air velocity $\mathrm{v}, \mathrm{m} / \mathrm{s}$

$$
\begin{equation*}
d=\operatorname{root}\left(L /\left(v^{*} 3600\right)\right) \tag{54}
\end{equation*}
$$

Diameter d, m, knowing loads $Q$, Gcal/h and temperature of coolant $\mathrm{T} 1 \& \mathrm{~T} 2{ }^{\circ} \mathrm{C}$ or flow rate $\mathrm{G}, \mathrm{m}^{3} / \mathrm{h}$ and setting water density $R, \mathrm{~kg} / \mathrm{m}^{3}$ and water velocity $\mathrm{v}, \mathrm{m} / \mathrm{s}$

$$
\begin{align*}
& G=Q * 1000 /(T 1-T 2)  \tag{55}\\
& d=2^{*} \operatorname{root}\left(G /\left(3,6^{*} R^{*} v^{*} p i()\right)\right) \tag{56}
\end{align*}
$$

## Path

Optimal path is chosen as maximum sum of benefit integrals and motion options are compared at each step.

If on a flat field are calculated benefits for each step, then visualization shows volumes: red maxima create optimal path.

## Visual Math

## Olympic points

Points integrally take into account quantity and quality of medals.
Pyramid of points $=$ gold * $3+$ silver *2 + bronze
Few countries get highest points and it is possible to unite countries.

## Logic

Deduction: reasoning from general maximum to private minimal individual

Induction: reasoning from particular minimum individual to general maximum

## Figure

Draw a figure, pencil from paper without taking it off

## Task 1

2 walkers walking towards each other at a distance of 10 km

Speed of 1 st walker is $3 \mathrm{~km} / \mathrm{h}$.
Speed of 2nd walker is $2 \mathrm{~km} / \mathrm{h}$.
From 1st walker, a drone takes off at same height at a speed of $10 \mathrm{~km} / \mathrm{h}$.
Drone flies to walking walker and turns back.
Drone flew between walkers all time until walkers met.
Q: How far did drone fly?

## Task 2

Airplane is at an altitude of 5000 m . How much is distance to horizon?

## Task 3

Given: 9 balls, 1 of which is lighter.
Determine light ball in 2 weighings.

## Task 4

Bottle plastic transparent closed filled with water by about half.

Determine in a second whether there is water of half in bottle
or more than water of half or less than water of half.

## Task 5

Plane flew south for 500 km .
Then plane flew east for 500 km and north for 500 km .
As a result, aircraft returned to its original starting point.
Q: Where did plane start from?
Hint: Solution in hemispheres of North and South.

## Task 6

Lliquid level shows horizontal.
Figure out vertical.
